

Q12 March 2009

Outline the pharmacology of an opioid injected into the spinal intrathecal space.

Pharmaceuticals

- Intrathecal morphine available as 500mcg/mL solution
- Fentanyl available as 50mcg/mL
- Intrathecal opioids must be preservative free
- If in a glass vial, must be drawn up through filter tip needle
- Indications: intra/post-operative analgesia

Pharmacodynamics

- Mechanism of action:
  - Bind to G-protein-coupled pre and post synaptic receptors in the dorsal horn
  - Causes G-protein-mediated K<sup>+</sup> channel opening (mu and delta receptors) → hyperpolarises cell
  - Causes G-protein-mediated Ca<sup>2+</sup> channel receptors (kappa receptors)
    - Causes reduction in intracellular Ca<sup>2+</sup>
    - Leads to decreased release of excitatory transmitters, glutamate and substance P
    - Consequent reduction in nociceptive transmission
- Side effects:
  - Pruritus
  - Nausea and vomiting
  - Urinary retention
  - Respiratory depression

Pharmacokinetics

	<b>Lipophilic e.g. fentanyl</b>	<b>Hydrophilic e.g. morphine</b>
<b>Absorption</b>	<ul style="list-style-type: none"> <li>• Highly potent</li> <li>• Rapid onset</li> <li>• Limited duration of action</li> </ul>	<ul style="list-style-type: none"> <li>• Slower onset</li> <li>• Longer duration of action</li> </ul>
<b>Distribution</b>	<ul style="list-style-type: none"> <li>• Bulk flow in caudal → cephalad direction</li> <li>• Fluctuating thoracic pressure changes (due to respiration) facilitate this flow</li> <li>• Uptake into posterior radicular artery means opioids can travel to brainstem</li> </ul>	
	<ul style="list-style-type: none"> <li>• Rapidly redistributes into other areas, including epidural fat, myelin, white matter</li> <li>• High volume of distribution in spinal cord</li> <li>• High pKa means less un-ionised molecule is available in receptor sites in grey matter</li> <li>• Rapid decreased in CSF concentration</li> <li>• Increased epidural and plasma concentrations</li> </ul>	<ul style="list-style-type: none"> <li>• Slow diffusion into the epidural space</li> <li>• Less redistribution into myelin and white matter (non-receptor sites)</li> <li>• Small volume of distribution in spinal cord</li> <li>• Sustained high concentration in CSF</li> </ul>
<b>Metabolism</b>	<ul style="list-style-type: none"> <li>• Removal from CSF facilitated by glycoprotein carrier transport in choroid plexus</li> </ul>	
	<ul style="list-style-type: none"> <li>• Opioids metabolised in liver to both active and inactive metabolites</li> <li>• Some extra-hepatic metabolism → kidney conjugate morphine</li> </ul>	
<b>Excretion</b>	<ul style="list-style-type: none"> <li>• In urine and bile</li> <li>• Water soluble glucuronides excreted in bile may be metabolised by gut flora back to parent opioid, and reabsorbed (enterohepatic recirculation)</li> </ul>
